Algoritmos Avançados

2021/2022 — 1° Semestre

1st Project — Exhaustive Search

Deadline: December 5, 2021

Introduction

Choose one of the following graph problems and design and test an exhaustive search algorithm to solve it, as well as an algorithm using a greedy heuristics.

Afterwards, analyze the computational complexity of the developed algorithms. To accomplish that:

- a) Perform a formal computational complexity analysis of the algorithms.
- b) Carry out a sequence of experiments, for successively larger problem instances, to register and analyze (1) the **number of basic operations** carried out, (2) the **execution time** and (3) the **number of solutions / configurations** tested.
- c) Compare the results of the experimental and the formal analysis.
- d) Estimate the execution time that would be required by much larger problem instances.
- e) Write a report (8 pages, max.).

Graphs for the Computational Experiments

The **graph instances** used in the **computational experiments** should represent the following scenario:

- graph **vertices** are 2D points on the XOY plane, with integer valued coordinates between 1 and 9.
- graph vertices should neither be coincident nor too close.
- the **number of edges** sharing a vertex is randomly determined.

Generate successively larger **random graphs**, with 2, 3, 4, ... vertices, using your student number as **seed**, and store each graph in a file to be used for the computational experiments.

Depending on the problem, it might be helpful to represent each graph by its **adjacency matrix** or by its **incidence matrix**.

It might be useful to graphically visualize the graph instances and the computed solutions.

Graph Problems

- 1 Find a **maximum clique** for a given undirected graph G(V, E), with n vertices and m edges. A **clique of** G is a subset of vertices, all adjacent to each other, i.e., defining a complete subgraph of G. A **maximum clique** is a clique with the **largest** possible number of vertices. Example: in a social network, a clique is a subset of people who all know each other.
- 2 Find a **maximum weight clique** for a given undirected graph G(V, E), whose **vertices carry positive weights**, with n vertices and m edges. A **clique of** G is a subset of vertices, all adjacent to each other, i.e., defining a complete subgraph of G. The **weight of a clique** is the sum of its vertices' weights. A **maximum weight clique** is a clique whose total weight is as large as possible.
- 3 Find a **maximum independent set** for a given undirected graph G(V, E), with n vertices and m edges. An **independent set of** G **is a subset of vertices, no two of which are adjacent. A maximum independent set** is an independent set of **largest** possible size. Example: in a social network, an independent set is a subset of people who do not know each other.
- 4 Find a maximum weight independent set for a given undirected graph G(V, E), whose vertices carry positive weights, with n vertices and m edges. An independent set of G is a subset of vertices, no two of which are adjacent. The weight of an independent set is the sum of its vertices' weights. A maximum weight independent set is an independent set whose total weight is as large as possible.
- 5 Find a **minimum vertex cover** for a given undirected graph G(V, E), with n vertices and m edges. A **vertex cover of** G is a set C of vertices, such that each edge of G is incident to, at least, one vertex in C. A **minimum vertex cover** is a vertex cover of **smallest** possible size.
- 6 Find a **minimum weight vertex cover** for a given undirected graph G(V, E), whose **vertices** carry positive weights, with n vertices and m edges. A **vertex cover of** G is a set C of vertices, such that each edge of G is incident to, at least, one vertex in C. The weight of a vertex cover is the sum of its vertices' weights. A **minimum weight vertex cover** is a vertex cover whose total weight is as small as possible.
- 7 Find a **minimum dominating set** for a given undirected graph G(V, E), with n vertices and m edges. A **dominating set of** G is a subset D of vertices, such that every vertex not in D is adjacent to, at least, one vertex in D. A **minimum dominating set** is a dominating set of **smallest** possible size. Application example: dominating sets are used in wireless networking to find efficient routes.
- 8 Find a minimum weight dominating set for a given undirected graph G(V, E), whose vertices carry positive weights, with n vertices and m edges. A dominating set of G is a subset D of vertices, such that every vertex not in D is adjacent to, at least, one vertex in D. The weight of a dominating set is the sum of its vertices' weights. A minimum weight dominating set is a dominating set whose total weight is as small as possible.
- 9 Find a **minimum edge cover** for a given undirected graph G(V, E), with n vertices and m edges. An **edge cover** is a set C of edges such that each vertex of G is incident to, at least, one edge in C. A **minimum edge cover** is an edge cover of **smallest** possible size.
- 10 Find a **minimum weight edge cover** for a given undirected graph G(V, E), with n vertices and m edges. An **edge cover** is a set C of edges such that each vertex of G is incident to, at least, one

- edge in C. The **weight of an edge cover** is the sum of its edges' weights. A **minimum weight edge cover** is an edge cover whose total weight is as **small** as possible.
- 11 Find a **minimum edge dominating set** for a given undirected graph G(V, E), with n vertices and m edges. An **edge dominating set** of G is a subset D of edges, such that every edge not in D is adjacent to, at least, one edge in D. A **minimum edge dominating set** is an edge dominating set of **smallest** possible size.
- 12 Find a **minimum weight edge dominating set** for a given undirected graph G(V, E), with n vertices and m edges. An **edge dominating set** of G is a subset D of edges, such that every edge not in D is adjacent to, at least, one edge in D. The **weight of an edge dominating set** is the sum of its edges' weights. A **minimum weight edge dominating set** is an edge dominating set whose total weight is as **small** as possible.
- 13 Find a **maximum cut** for a given undirected graph G(V, E), with n vertices and m edges. A **maximum cut of** G is a partition of the graph's vertices into two complementary sets S and T, such that the number of edges between the set S and the set T is as **large** as possible.
- 14 Find a maximum weighted cut for a given undirected graph G(V, E), with n vertices and m edges. A maximum weighted cut of G is a partition of the graph's vertices into two complementary sets S and T, such that the sum of the weights of edges between the set S and the set T is as large as possible.
- 15 Find a **minimum cut** for a given undirected graph G(V, E), with n vertices and m edges. A **minimum cut of** G is a partition of the graph's vertices into two complementary sets S and T, such that the number of edges between the set S and the set T is as **small** as possible.
- 16 Find a **minimum weighted cut** for a given undirected graph G(V, E), with n vertices and m edges. A **minimum weighted cut of** G is a partition of the graph's vertices into two complementary sets S and T, such that the **sum of the weights of edges between the set S and the set T** is as small as possible.
- 17 Find a **maximum weighted closure** for a given vertex-weighted directed graph G(V, E), with n vertices and m edges. A **closure of G** is a set of vertices C, such that no edges leave C. The **weight of a closure** is the sum of its vertices' weights. A **maximum weight closure** is a closure whose total weight is as large as possible.
- 18 Find a **minimum weighted closure** for a given vertex-weighted directed graph G(V, E), with n vertices and m edges. A **closure of** G is a set of vertices C, such that no edges leave C. The **weight of a closure** is the sum of its vertices' weights. A **minimum weight closure** is a closure whose total weight is as small as possible.
- 19 Find a **maximum matching** for a given undirected graph G(V, E), with n vertices and m edges. A **matching in** G is a set of pairwise non-adjacent edges, i.e., no two edges share a common vertex. A **maximum matching** is a matching of **largest** possible size. Application example: computational chemistry.
- 20 Find a **maximum weighted matching** for a given undirected graph G(V, E), with n vertices and m edges. A **matching in** G is a set of pairwise non-adjacent edges, i.e., no two edges share a common vertex. A **maximum weighted matching** is a matching for which the **sum of the weights** of its edges is as large as possible.

- Find the **chromatic number** of a given undirected graph G(V, E), with n vertices and m edges. The **chromatic number of** G is the **smallest** number of colors needed to properly **color the vertices** of graph G, i.e., to label the vertices with colors such that no two adjacent vertices have the same color. Application example: vertex coloring is used for register allocation in compilers.
- Find the **chromatic index** of a given undirected graph G(V, E), with n vertices and m edges. The **chromatic index of** G is the **smallest** number of colors needed to properly **color the edges** of graph G, i.e., to label the edges with colors such that no two edges sharing the same vertex have the same color. Application example: edge coloring is used for frequency assignment for fiber optics networks.
